Isotropic CMB Background

Map of the Cosmic Microwave Background (CMB)

Credit: NASA/WMAP Science Team

Angular Power Spectrum of CMB Anisotropies

Credit: NASA/WMAP Science Team

Criteria

Fig. 1a. Diagram of gravitational instantion in the objecting model. The region of instantial is a located to the right of the line $M_3(t)$; the region of stability to the left. The two additional lines of the graph demonstrate the temporal evolution of density perturbations of matter: growth until the moment when the considered mass is smaller than the Jeans mass and oscillations thereafter. It is apparent that at the moment of recombination perturbations corresponding to different masses correspond to different phases.

Key Realization

R. Sunyaev and Y. Zel'dovich, Astrophys. and Space Science **7**, 3 (1970); P. Peebles and J. Yu, Ap. J. **162**, 815 (1970).

Conclusions

Fig. 1a. Diagram of gravitational instability in the "big-bang' model. The region of instability is located to the right of the line A(r) the region of stability to the left. The version of stability is the graph demonstrate the temporal evolution of density perturbations of matter; growth until the moment when the considered mass is smaller than the bases mass and oscillations thereoffer. It is apparent that at the moment of recombination perturbations corresponding to different masses correspond to different phases.

Fig. 1b. The dependence of the square of the amplitude of density perturbations of matter on scale. The fine line designates the usually assumed dependence $(\delta g_i \phi)_{bc} \sim M^{-n}$. It is apparent that fluctuations of relic radiation should depend on scale in a similar manner.

Successes of Inflation

String Cosmology

R. Brandenberger

Introduction

Inflation

Challenges

Ekpyrosis

S-Brane Ekpyrosis

Predictions

String Cosmolog

String Gas Cosmology Matrix Theory Cosmology

- Inflation renders the universe large, homogeneous and spatially flat, i.e. solution of the horizon and flatness problems of SBB cosmology
- $\bullet\,$ Classical matter redshifts \rightarrow matter vacuum remains
- Quantum vacuum fluctuations: seeds for the observed density fluctuations [Chibisov & Mukhanov, 1981] and gravitational waves (Starobinsky, 1978).
- Approximately scale-invariant spectra of density fluctuations and gravitational waves.
- Small red tilt of the spectrum of density fluctuations.
- Prediction: Small red tilt of the spectrum of gravitational waves.

Obtaining Inflation

Trans-Planckian Problem

J. Martin and R.B., *Phys. Rev. D63, 123501 (2002)*

- Success of inflation: At early times scales are inside the Hubble radius → causal generation mechanism is possible.
 - **Problem:** If time period of inflation is more than $70H^{-1}$, then $\lambda_p(t) < I_{pl}$ at the beginning of inflation.

31/100

 → breakdown of effective field theory; new physics MUST be taken into account when computing observables from inflation.

<u>Trans-Planckian Censorship Conjecture (TCC)</u>

String Cosmology R. Brandenberger Challenges

No trans-Planckian modes exit the Hubble horizon.

$$rac{a(t_R)}{a(t_i)} I_{pl} < H(t_R)^{-1}$$

- String Gas Cosmology Matrix Theory Cosmology
- Conclusions

- There is a vast landscape of effective field theories.
- Any space-time dimension, and number of fields, any shape of the potential, any field range.
- Superstring theory is very **constraining**.
- Only a small subset of all EFTs is consistent with string theory.
- The rest lie in the swampland.

String Gas Cosmology Matrix Theory Cosmology

Conclusions

Our work:

- S-brane mediates a continuous bounce.
- Gravitational waves passing through the brane acquire a scale-invariant spectrum.
- If the S-brane has zero shear, then a scale-invariant spectrum of curvature fluctuations is generated.
- **Two consistency relations** among the four basic cosmological observables.

Introduction Inflation

Ekpyrosis

S-Brane Ekpyrosis

Predictions

String Cosmology

String Gas Cosmology Matrix Theory Cosmology

Conclusions

Which variable passes through the bounce continuously?

ome previous results:

- At the reheating transition in inflationary cosmology it is the variable *v* which is continuous, and Φ jumps (by a large factor).
- In models with a smooth bounce mediated by matter which violates the Null Energy Condition the variable *v* is continuous, and not Φ.
- For a space-like matching surface, most choices of the location of the surface lead to Φ being continuous (Durrer and Vernizzi, Phys. Rev. D 66, 083503 (2002)).

String Gas Cosmology Matrix Theory Cosmology

Conclusions

Which variable passes through the bounce continuously?

Some previous results:

- At the reheating transition in inflationary cosmology it is the variable *v* which is continuous, and Φ jumps (by a large factor).
- In models with a smooth bounce mediated by matter which violates the Null Energy Condition the variable *v* is continuous, and not Φ.
- For a space-like matching surface, most choices of the location of the surface lead to Φ being continuous (Durrer and Vernizzi, Phys. Rev. D 66, 083503 (2002)).

Conclusions

Consider the equation

$$X''_k(\tau) + \left[k^2 + m\delta(\tau - \tau_B)\right]X_k(\tau) = 0.$$

- Solutions: plane waves for $\tau < \tau_B$ and for $\tau > \tau_B$.
- Positive frequency solutions f_k and negative frequency ones f^{*}_k.
- Bogoliubov mode mixing across the transition surface.
- Pure positive frequency before τ_B can be written for $\tau > \tau_B$ as

$$X_k = \alpha_k f_k + \beta_k f_k^*,$$

• where α_k and β_k are the Bogoliubov mode matching coefficients.

Introduction Inflation Challenges

Ekpyrosis

S-Brane Ekpyrosis

Predictions

String Cosmology String Gas Cosmology Matrix Theory Cosmology

Conclusions

By integrating over time τ against a test function (a smooth function which decays exponentially at $\tau \to \pm \infty$) $f(\tau)$ it can be easily shown that

$$\beta_k = \frac{m}{k}.$$

This is the factor which transforms a vacuum spectrum into a scale-invariant one.
